

Assignment 2: Quantum Phase Estimation Run the quantum phase estimation algorithm with parameters $\theta = 0.5$ and $t = 5$ according to the notation used in the Quantum Phase Estimation Jupyter file. What you must submit Submit one single .ipynb file. Your submitted notebook must contain only the following: The Qiskit code that you actually ran An image of the quantum circuit, generated using `.draw('mpl')` An image of the measurement histogram, generated using `plot_histogram(...)` Your calculations showing how you derive θ from the histogram data

Important instructions Your submitted notebook must contain only: the code you actually ran, the circuit image, the histogram, and your calculations deriving θ .
